

Experiment 6

Write the Python Program to Implement List Methods (Add, Append, Extend & Delete)

Aim

To write a Python program to implement the given list methods.

Algorithm

Step 1: Create an empty list.

Step 2: Add an element using `append()`.

Step 3: Add multiple elements using `extend()`.

Step 4: Insert an element using `insert()`.

Step 5: Remove an element using `remove()`.

Step 6: Delete an element using `pop()`.

Step 7: Display the updated list after each operation.

Program

```
my_list = []

my_list.append(1)
print("List after append:", my_list)

my_list.append(2)
print("List after second append:", my_list)

my_list.extend([3, 4, 5])
print("List after extend:", my_list)

my_list.insert(2, 10)
print("List after insert:", my_list)

my_list.remove(3)
print("List after remove:", my_list)

my_list.pop()
print("List after pop:", my_list)
```

```
del my_list[1]  
print("List after delete:", my_list)
```

Output

List after append: [1]
List after second append: [1, 2]
List after extend: [1, 2, 3, 4, 5]
List after insert: [1, 2, 10, 3, 4, 5]
List after remove: [1, 2, 10, 4, 5]
List after pop: [1, 2, 10, 4]
List after delete: [1, 10, 4]

Result

Hence, the simple Python program to implement the list methods was executed successfully.
